Small Business

The Challenge

Seriun was challenged to upgrade our clients I.T system, with cost as the highest priority of the project we did not want this to affect the delivery of powerful and valuable services to our client. We were required to provide this client with a solution that only larger companies could afford in the past, Replace all the desktops PC's to provide an updated and unified platform, provide a Server for centralised storage and e-mail, calendaring, tasks and public folders. An intranet/extranet was required as the client wished to use the integration with office to provide a repository for company documents and open a section of this to its customers for them to read and update various components on the extranet. Provide backup facilities, broadband and cost effective ongoing support.

Our solution

We employed Microsoft Small Business Server 2003 as this provided all the features required in an extremely cost effective package. Seriun Procured Dell desktops and a Small business Dell server which provided ample power and reliability for an extremely competitive price. Seriun then configured all the required services and delivered internet connectivity using our cost effective internet service provider – Seriun.net. A cost effective backup and antivirus solution was implemented providing the added piece of mind and security.

The Benefits

On budget we meet all the requirements and our client feels they are in a unique position to be more competitive both in the small and the larger business sector; coupled with our innovative solutions and their ability to provide focused services to their customers they feel extremely excited and are poised to grow their business and extend their service offerings building upon their stable infrastructure. Seriun look forward to being their partner and wish them all the best in the future.
